

FFW: BioContainers

Description: Ready to mix it up? In this webinar, we apply what you've learned about basic container technology, such as Docker, with open source bioinformatics apps for Proteomics, Genomics, Transcriptomics and Metabolomics. The benefits of running containerized software--saving you the time and headache of installing software packages and their dependencies--are the same but BioContainers provide ready-to-use packages and tools that can be easily deployed within CyVerse and used in local machines, HPC and cloud architectures.
