

Regular Expressions

This is a tool for composing regular expressions in PHP, Java, and Python: <https://regex101.com/>

- The explanation pane on the top right of the page is the best way I have found to learn regular expression syntax.
- The code generator on the left hand menu will give you the proper syntax to import the "re" library and execute your regular expressions in Python.
- The tool is excellent for testing regular expressions on sample data sets, I was able to copy and paste a few sequences from my FASTA file and test the different amino acid motifs that I was trying to identify.
